METHODOLOGY

The NBC News|SurveyMonkey Mississippi Poll was conducted online among a sample of 1,171 adults aged 18 and over who live in Mississippi, including 1,042 who say they are registered to vote. The poll was conducted from July 2, 2019 until July 16, 2019. Respondents for this survey were selected from the more than two million people who take surveys on the SurveyMonkey platform each day.

A multi-stage raking was employed to construct state-level registered voter weights. First, postal zip codes are classified into clusters according to their population size, population density, median income and race compositions. Zip code-level characteristics are obtained from the American Community Survey and publicly available zip code databases. Initial weights are constructed by weighting the sample to zip code-level group targets. The initial weights are then raked by gender, age, race and education to match targets obtained from the American Community Survey. The third state of raking weights initial weights to gender, age, race and education of forecasted registered voters for non-voters of 2016 general election and gender, age, race and education of forecasted registered voters and presidential vote for voters of 2016 general election. A time-series based model was employed to forecast registered voter composition, given the Current Population November Supplement samples from 1994 through 2016. The state-level presidential vote targets are obtained from the Federal Election Commission.

Because the sample is based on those who initially self-selected for participation rather than a probability sample, no estimates of sampling error can be calculated. All surveys may be subject to multiple sources of error, including, but not limited to sampling error, coverage error, and measurement error.

To assess the variability in the estimates and account for design effects, we create a bootstrap confidence interval to produce an error estimate. The bootstrap confidence interval for this survey among registered voters is plus or minus 4.2 percentage points.

To calculate the bootstrap confidence interval, we use the weighted data to generate 5,000 independent samples and calculate the 95% confidence intervals for the weighted average. When analyzing the survey results and their accuracy, this error estimate should be taken into consideration in much the same way that analysis of probability polls takes into account the margin of sampling error.
